java -jar Myapp-0.0.1-SNAPSHOT.jar --server.port=5000

```

3. **Wait for the "Started" log.**

4. **VisitYou have successfully started the application on your **local machine** (D:\Key), and it is listening on port **5000**.

However, the previous `ERR_CONNECTION_REFUSED` error you saw in the browser occurred because you were trying to access the **EC2 IP address** (13.126.242.221), but the application was not running *on* the EC2 instance at that moment.

To see your "Good Morning" or "Welcome" message now, you have two choices:

### Option A: Test on your Local Machine

Since the logs show the app is running on your local PC:

* **URL:** `http://localhost:5000/base/all`

* **URL:** `http://localhost:5000/base/greet`

---

### Option B: Run it on the EC2 Instance (Publicly)

If you want the application to be accessible via the Public IP (**13.126.242.221**), you must run that exact command inside your **SSH terminal** (the one with the Amazon Linux logo), not your local D: drive terminal.

1. **Switch to your SSH Terminal window.**

2. **Run the command there:**

   ```bash

```
java -jar Myapp-0.0.1-SNAPSHOT.jar --server.port=5000
```

3. **Wait for the "Started" log.**

4. **Visit the Public URL:**

`http://13.126.242.221:5000/base/allYou have successfully started the application on your **local machine** (D:\Key), and it is listening on port **5000**.

However, the previous `ERR_CONNECTION_REFUSED` error you saw in the browser occurred because you were trying to access the **EC2 IP address** (13.126.242.221), but the application was not running *on* the EC2 instance at that moment.

4. **Visit the Public URL:**

   `[http://13.126.242.221:5000/base/all](http://13.126.242.221:5000/base/all)`

Pro-Tip for the Consultant

I noticed your local machine is running **Java 21.0.11**, while your EC2 instance currently has **Java 17**. Since your Spring Boot version is **3.5.4**, it is highly optimized for newer Java features.

If you run into a `java.lang.UnsupportedClassVersionError` on the EC2 instance, you will need to upgrade the EC2 Java version to 21:

```bash

sudo dnf install java-21-amazon-corretto-devel –y

scp -i MyFirst.pem Myapp-0.0.1-SNAPSHOT.jar ec2-user@13.126.242.221:~
```

```
D:\>cd key

D:\Key>scp -i MyFirst.pem Myapp-0.0.1-SNAPSHOT.jar ec2-user@13.126.242.221:~
Myapp-0.0.1-SNAPSHOT.jar                                      100%   20MB   1.4MB/s   00:14

D:\Key>
```

```bash
ssh

nohup java -jar Myapp-0.0.1-SNAPSHOT.jar > app.log 2>&1 &

sudo netstat -tulpn | grep 8080
```
